- ▶ When using the 'AVKT 1004R-HF' insert, the cutter body needs to be modified to a corner radius of 3.0 mm
- ▶ For "AVKT 10" inserts with a corner radius larger than 1.6 mm ( $RE > 1.6$  mm), modify the cutter body corner radius as follows:  $R = RE + 0.2$  mm

Technical drawing of a DC motor with the following dimensions and labels:

- DRVS**: Drive shaft
- DC**: Direct Current
- APMX**: Armature pin diameter
- LF**: Length of frame
- OAL**: Overall length
- THSMS**: Threaded shaft diameter
- DCONMS**: Drive shaft diameter

Technical drawing of a yellow cylindrical component. The drawing includes a side view on the left showing a width dimension  $S$ . The main view on the right is a front view showing a diameter dimension  $W_1$  and two height dimensions:  $APMX$  (from the base to the top of the inner cylinder) and  $NSL$  (total height from the base to the top of the outer cylinder).

[illegible]

Two cross-sectional diagrams of pipe fittings. The left diagram shows a flange fitting with four yellow bolts, labeled F74 F102. The right diagram shows a butt-weld fitting with a yellow weld bead, labeled F187.

The technical drawing shows a hexagonal nut. The side view on the left indicates a thickness  $S$ . The top view on the right shows a hexagonal shape with an inscribed circle diameter  $IC$ . The base of the nut is labeled  $BS$  (base surface) and  $RE$  (recessed area). The height of the nut is labeled  $AF_{MX}$ . A  $45^\circ$  chamfer is shown on the top edge of the nut.

## ► How to use splitter

- 3 splitting grooves on one cutting edge and 2 splitting grooves on the opposite side

APKT

ANHX

- Full proof configuration-inserts have metal color appearance only on the 3 groove side for simplified mounting

**Notice:** When insert mounting, ensure they are mounted in a staggered formation i.e. 1st tooth-2 groove side; 2nd tooth-3 groove side and repeat action for the remaining teeth

- Both cutting edges split chip to small pieces for cutting load reduction and create complete cutting edge when combined.

- For optimum machining efficiency, use even numbered flute type cutters

Also applicable to odd numbered flute type cutters

- The splitter inserts effective in axial depth of cuts  $\geq d_1$

| Depth of cut | APKT 17 | APKT 12 |
|--------------|---------|---------|
| d1           | 3mm     | 2.4mm   |
| d2           | 6.5mm   | 5.2mm   |

| Depth of cut | ANHX 16 |
|--------------|---------|
| d1           | 2.5mm   |
| d2           | 6mm     |

## ▶ Setting instructions

Height gauge

Insert

Insert screw

Adjust wedge

Wedge screw

T-Wrench

- 1 Move the adjust wedge to its bottom-most position by rotating the wedge screw clockwise.

\*Please avoid using too much force.

- 2 Mount new cutting edge of insert. Make sure that the insert pocket is thoroughly cleaned before mounting insert.

\*Please fix the insert screw completely as readjustment is not expected once it is done.

- 3 Measure the Runout of the cutter when all inserts are mounted and select the highest insert as a reference.

\*Please ensure that insert edge does not get damaged during setting. Use optimum dial pressure only.

- 4 Set the height of cutter, raising the reference insert by turning the wedge screw counter clockwise.

\*Increase height by 0.01mm at least from the highest insert.

- 5 Adjust axial Runout of the remaining inserts with the same process as used with the reference insert.

\*Please note that max adjustment height should not exceed 0.1mm(.004")

- 6 Adjust Runout in the range of 0.005mm rotating the wrench gradually.

- 5 If it is beyond the acceptable range, please reset it with the order of 1 - 2 - 5

- 6 Runout adjustment is completed.(you don't have to clamp the insert screw anymore once it is fixed.)

## ► Gauge user guide

## ► Special precautions

- While loading a new insert corner, ensure that the adjust wedge is in the bottom-most position  
Bottom out the adjust wedge completely before unclamping the insert from cutter
- Clean the insert and pocket thoroughly before mounting fresh insert /corner
- While assembling adjust wedge onto cutter body, please ensure that the adjust wedge is tightened until it reaches the bottom

## ► TOPSLOT component names

## ► TOPSLOT setup instructions

### ■ Disk type

B=Cutting width (Target width)  
H=Cutter height (Datum)  
A=Width of cutter body  
X=Distance between insert and cutter body

### ■ Flange type

## ► Setting procedure

### ■ Disk type

- 1 Index unused inserts firmly onto the cartridge.

- 2 Unfasten the wedge screw 1 turn counter-clockwise.

- 3 After fastening the wedge around 80%, adjust the cartridge to the desired "X" value after setting the datum zero point.

- 4 Follow the same method about other cartridges. (the same as opposite side)

- 5 After setting all cartridges, sequentially fasten the wedge 100% over two or three times.

- When adjusting cartridge to the "X" value, set the location of cartridge higher than "X" value and then adjust the cartridge to the "X" value.
- Clockwise rotation : cartridge descends.
- Counter-clockwise rotation : cartridge ascends.

### ■ Flange type

- 1 For setting of bottom face, repeat disk type steps 1-4. (The datum is bottom plane of flange type cutter.)

- 2 For top face set-up, the use of setting plate is mandatory and the height gauge must be reset to '0' for each insert.

- 3 Put the cutter bottom face on the setting plate and unfasten wedge screw 1 turn counter-clockwise

- 4 After fastening the wedge around 80%, adjust the cartridge to the desired (A+X) value.

- 5 Follow the same method about other cartridges.

- 6 After setting all cartridges, sequentially fasten the wedge 100% over two or three times.

- When adjusting cartridge to the "X" value, set the location of cartridge higher than "X" value and then adjust the cartridge to the "X" value.
- Clockwise rotation: cartridge descends.
- Counter-clockwise rotation: cartridge ascends.

## ► Setting notice

### ■ Important set-up points

- All adjustments must be done on a plane, flat surface.
  - For improved accuracy, remove any foreign substances from the insert and insert pocket surfaces before clamping.
  - During reassembly wedges and wedge screws, you must apply lubricant of the friction surface. (Fig.1)
  - "X" value must be equal for both top and bottom faces when adjusting the width of slot. (Fig.2)
  - Width of cut must be adjusted within the range of the laser marked on the cutter. (Fig.3)
- Ex) WIDTH 12-13 / WIDTH 20-23
- When adjusting cartridge to the "X" value, set the location of cartridge higher than "X" value and then adjust the cartridge to the "X" value.

Fig.1 Lubricant

Fig.2 "X" setting

Fig.3 WIDTH

## ► Narrow width slotting cutters

- Metric cutting diameters:  
75mm, 100mm, 125mm, 160mm, 250mm
- Cutting width ranges: 1.6mm - 6.35mm
- Geometry: Positive Rake
- Applications: Slotting and sawing
- Materials: Carbon steels, alloy steels, stainless steels, cast iron, aluminum and exotics

### ■ Features / Benefits of slotting cutters

- Narrow width applications to 1.6mm
- Simple easy-to-mount inserts
- Secure insert retention self-positioning insert stopper for repeatability
- Drive flange mounting for extra stability
- Minimal radial runout
- Efficient chip evacuation
- Reduced cutting forces
- Improved tool life
- Economical

## ► Recommended feed rates for - TSC slotting cutters

Drive flange set  
recommended for  
style 2 cutters

► Recommended feed rates (Based on insert width)

Feed rates are for radial  
D.O.C. => 1/4 the cutter diameter  
For radial DOC < 1/4 the cutter diameter  
increase feed rates by the following %

|                          |     |     |     |      |      |
|--------------------------|-----|-----|-----|------|------|
| DOC/Cutter diameter      | 1/4 | 1/6 | 1/8 | 1/10 | 1/20 |
| Increase feed rate by -> | 0%  | 15% | 30% | 45%  | 45%  |

- Cutter entry  
Climb milling enters the workpiece with a thick chip and exits with a thin chip. Honed inserts are recommended.  
Conventional milling enters the workpiece with a thin chip and exits with a thick chip. Sharp inserts are recommended. Climb milling should be used whenever possible, especially when replacing high speed steel slotting cutters. On machines with backlash eliminators, climb milling is preferred.
- Cutter mounting  
The use of drive flange sets are recommended to prevent denting of arbor drive keys and to provide added stability during increased metal removal rates.
- Insert mounting  
Manually place insert in pocket and seat in place by using a wooden or plastic hammer. This will ensure self positioning for insert repeatability and minimal radial runout. Pockets must be clean and free of debris prior to installation.

**4 flute medium flat**

- 
- Technical drawing of a double-flute drill bit. The main view shows the drill bit with dimensions: DC (cutting diameter), APMX (flute length), LU (length of the cutting edge), and OAL (overall length). The drill bit is labeled DCONMSH6. A cross-section view on the right shows the double-flute design with angles  $\alpha_1$  and  $\alpha_2$ , and a note  $\alpha_1 \neq \alpha_2$ .

## 4 flute medium corner radius

- 
- Technical drawing of a double-flute drill bit. The drawing shows the side view and a cross-section. Dimensions and labels include:
- RE**: Chamfer radius at the tip.
  - DC**: Drill diameter.
  - APMX**: Axial distance from the tip to the start of the double-flute section.
  - LU**: Length of the double-flute section.
  - OAL**: Overall length of the drill.
  - DCONMSH6**: Drill diameter tolerance class.
  - Flute Angles**: The cross-section shows four flutes with angles  $\alpha_1$  and  $\alpha_2$ . A note indicates  $\alpha_1 \neq \alpha_2$ .

► \*: Optional, sold separately

Technical drawing of the ER11 SPR EX..AA connector. The drawing shows a side view of the connector with the following dimensions and labels:

- LS**: Length of the main body.
- DCONMS<sub>Sh</sub>**: Diameter of the main body.
- Ø81**: Diameter of the main body.
- LPR**: Length of the protruding part.
- OAL**: Overall length.
- ER11 SPR EX..AA**: Label for the protruding part.
- BD**: Diameter of the protruding part.
- DCONXWS**: Diameter of the protruding part.

A small icon of a water tap is located in the bottom right corner.

146 G

Technical drawing of a 1/2" ER11 collet. The main view shows the collet with dimensions: DCONMS (total length), Ø81 (inner diameter), LF (length of the first section), LPR (length of the second section), OAL (overall length), and BD (body diameter). A detail view on the right shows the DCONWS (collet nut) with its own dimension.

- ▶ Coolant pressure: 40 - 70 bar and flow rate: 16 - 22 l/min
- ▶ Rotational spindle speed [rpm]: 25,000 - 45,000 (rev/min)
- ▶ The spindle provides only external strong coolant jet around the tool
- ▶ DCONWS: Maximum diameter of tools

▶ \*: Optional, sold separately

## Coolant driven high-speed compact angular head spindle

| Designation        | Dimension (mm) |    |    |     |     |     |
|--------------------|----------------|----|----|-----|-----|-----|
|                    | DCONMS         | LS | LB | OAL | OAH | OAW |
| <b>TJS M90-3.0</b> | 10             | 25 | 20 | 58  | 29  | 27  |

- Coolant pressure 20 – 40 bar and flow rate 10 - 20 ℓ/min
- Rotational spindle speed [rpm]: 35,000–53,000 (rev/min)
- The spindle provides only external strong coolant jet around the tool
- TD: TL (Tool Length)+33 mm

# TJS M00

## Coolant driven high-speed compact spindle

| Designation        | Dimension (mm) |      |      |     |     |
|--------------------|----------------|------|------|-----|-----|
|                    | DCONMS         | LS   | OAL  | OAH | OAW |
| <b>TJS M00-3.0</b> | 10             | 23.8 | 61.8 | 26  | 31  |

- Coolant pressure: 15 - 40 bar and flow rate: 10 - 20 ℓ/min
- Rotational spindle speed [rpm]: 18,000 - 40,000 (rev/min)
- The spindle provides only external strong coolant jet around the tool

## Universal rotary tool clamping fixtures - for tapered shanks

[illegible]

# EASYLOCK T.C EU

Choose the correct wrench size.  
Mount it on the wrench holder.

Place the wrench on the collet chuck nut

Mount the Collet chuck into the unit spindle

Torque selector

Power lamp

To unclamp - Push and hold in the "unclmap" button until the collet chuck is totally open

To clamp - Push and hold in the "clmap" button until the collet chuck is totally open

Ensure that main poser switch is on and that the power supply cable is connected

700  
340  
500

■ **Specifications**

- Motor : Phase 200/240V, 50/60HZ(1HP)
- Spindle : Taper #40, 50 HSK 63, 100
- Weight : Table model - 85kg  
Trolley (Optional) - 15kg

**Note:** Assemble the collet and cutting tools. By hand, place the nut onto the collet chuck.

► Should be ordered separately

## Requirements

- 16A 5-pin industrial socket for AP and BS units

- G3/8 fittings only for AP unit to connect 4 bar air

## Installation & Operation video

- AP induction unit

- BS induction unit

# Technical Data

## ► ER-SEAL collet

### ■ Application

ER collets are used for applications requiring through coolant, as well as for standard cutting tools such as drills, boring bars, end mills, reamers, taps and special tools.

They provide an effective solution for accurate controlled coolant flow.

Front sealing collets are available for advanced high speed machines with through coolant spindles/turrets.

They provide maximum performance, high cutting speeds, extended tool life and high quality surface finish.

### ■ Features

- A revolutionary high precision front sealing collet with 1.00mm collapsibility that has through coolant capability
- Increased machining efficiency
- Extended tool life
- Has powerful gripping and parallel clamping
- Front sealing provides protection from contamination
- Fast chip removal from work piece

### ■ Advantages

- High-pressure coolant supply up to 100 bar
- Eliminates coolant flow interference

### ■ Notes

- For maximum security and clamping power, the cutting tool shank must be inserted into the collet to a minimum depth of 2 x shank diameter
- Suitable for all shank standards

## ► TaeguTec ER coolant sealed collet

### ■ Two types:

Oil hole collet: ER-SEAL

For straight shank cutting tools with internal coolant supply

JET2 collet: ER-SEAL-JET

With angular double nozzle.

Coolant flow is direct to the cutting edge

- For use with standard straight shank cutting tools (Without coolant hole)

## ► Shank standards

# Technical Data

## ► ER - Top clamping nut DIN6499

### ■ Description

The friction ER Nut has a unique two piece exclusive friction mechanism combining radial and angular self-centering movements.

### ■ Features

- Unique two piece friction bearing
- Radial and angular float for better concentricity
- Powerful gripping force, 50-100% higher than standard ER nut due to the friction bearing mechanism
- Balanced for higher spindle speed due to unique extractor teeth design
- Compact design: General dimensions and size range are the same as the standard nut sealed design for use with sealed collets.

### ■ Operation

To insert collet: Always assemble the collet into the nut before mounting onto the collet chuck.

### ■ Inserting procedure

Insert the collet slantwise, fitting the two protruding extractor teeth (A) into the collet groove (B).  
Place the two parts onto a clean and horizontal surface.  
Press down with your thumb on the back end of the collet until it clicks into place (C).

### ■ Important

Never insert the collet parallel to the extractor ring. This will chip or break the teeth of the extractor.  
When unclamping the nut, the collet will self release from the chuck by means of the extractor teeth.

# Technical Data

## ► ER - Top clamping nut DIN6499

- Extracting procedure
  - ➊ Align the diamond-shaped engraved logo which is on the silver ring (D) to any of the key slots (E) of the nut.
  - ➋ Place the nut with the collet facing down on a clean and horizontal work surface.
  - ➌ Insert a screwdriver vertically between the nut slots and the collet - on the reverse side of the diamond shaped engraved logo (D).
  - ➍ Tilt the screwdriver outwards while helping the extraction by pushing the back of the collet in the opposite direction (F).

### Note:

For maximum performance the clamping nut thread and collet taper must be cleaned and oiled before use.

**Recommended clamping torque for standard ER & ER-Top clamping nut.**

| Nut type | Kg × m |
|----------|--------|
| ER-11    | 5      |
| ER-11M   | 3      |
| ER-16    | 7      |
| ER-16M   | 4      |
| ER-20    | 12     |
| ER-20M   | 8      |
| ER-25    | 20     |
| ER-32    | 22     |
| ER-40    | 25     |
| ER-50    | 35     |

### Important:

The torque is calculated to suit the maximum diameter capacity of each collet. The torque should be gradually reduced when used with a smaller shank size.

# Technical Data

## ► TSK slim collet chuck

- Features & advantages
  - Excellent accuracy & good gripping power by gentle taper angle (ER collet : 8°, TSK collet : 4°)
  - Slim design for deep and cavity machining
  - Suitable on high speed machining
  - Variety of TSK collets (Normal & coolant type)
  - General machining using drill & end mill
- Application
  - General machining using drill & end mill
  - High speed machining for mold & die industry
  - Accurate machining using reamer & end mill
- How to assemble the collet with a nut

a. Assembly device  
(Optional, sold separately)

b. Nut

c. Collet

- 1 Insert the back end of the collet (c) into the assembly device (a)
- 2 Insert the combined part (a+c) in the nut (b)
- 3 Pluck out the assembly device (a) from the remaining part (b+c)

| a. Assembly device | Designation                    |
|--------------------|--------------------------------|
|                    | TSK 06, TSK 10, TSK 16, TSK 25 |

# Technical Data

## ► HSK (DIN69893) system

### ■ Features

- DIN standard
- For high speed machining
- Size: #32, 40, 50, 63, 100
- For A.T.C. & manual machine
- Double face contact
- High stiffness

## ► Radial stiffness of different machine tool interface

## ► Type

■ A type: Automatic tool change

■ B type: With coolant through face

■ C type: Manual clamp

■ D type: With coolant through face

■ E type: Super high speed

■ F type: Ultra high speed

# Technical Data

## ► Milling chuck

- Exceptional gripping power and simple operation

- Torque

| Type    | Torque (kgf•m) |
|---------|----------------|
| NTMC 25 | 180            |
| NTMC 32 | 360            |
| NTMC 42 | 520            |

Tighten slightly when collar is close to body (Avoid hammering)

- Improved accuracy prolongs tool life

The accuracy and low runout has been achieved by utilizing precise grinding and spiral laser slitting to avoid damage and tool distortion.

## ► Hydraulic chuck

### ■ Tool Fastening

- As shown in Figure 1, after inserting the tool while observing the Lmax and Lmin of the hydraulic chuck, tighten the clamping screw by rotating it clockwise by the specified torque value.

### ■ Tool Releasing

- Remove the tool by rotating the clamping screw counter clockwise approximately 3-4 times.

### ■ Notice

1. Before tightening the tool, remove dust from the inside of the hydraulic chuck and the tool shank, and ensure they are dry and clean. This will improve tool runout and clamping force after fastening.
2. The minimum insertion depth of the tool, Lmin, must be observed when in use.  
This prevents changes in the hydraulic chuck's internal diameter or loss of hydraulic oil.
3. Clamping screws must be fully locked to the recommended torque value.  
This prevents tool breakage, loss of hydraulic oil, and ensures optimal machining performance.
4. A cylindrical shank tool with h6 tolerance is recommended to ensure clamping force.
5. Weldon shank tools must be tightened using collets to prevent changes in the hydraulic chuck's internal diameter and damage.
6. If not used for long periods of time, tools should be removed and stored in a clean condition to minimize loss of hydraulic oil.
7. The clamping screw must not be tightened without the tool inserted to prevent changes in the hydraulic chuck's internal diameter and damage.
8. The vent bolt must not be disassembled by the customer.

► Thermal T-SHRINK chucking system

► T-SHRINK chucking system

The thermal T-SHRINK ER collet chucking system is an enhancement to the existing popular ER system. The T-SHRINK collets utilize the thermal shrink phenomena for rigid clamping of solid carbide cutters. This new system provides higher torque, precision runout and better repeatability. The T-SHRINK collets with their slim design and different projection length allows the user to reach into deeper cavities and perform narrow milling applications. TaeguTec offers a complete system for T-SHRINK ER collets, including a uniquely designed heating unit with a portable heating handle. The unit is equipped with a high-tech temperature control for easy and practical use at the machining center or in the tool room.

■ For carbide tools only

| L(mm) | Max. T.I.R |
|-------|------------|
| 35    | 7 $\mu$ m  |
| 60    | 9 $\mu$ m  |
| 85    | 10 $\mu$ m |

## ► GTI-Tap attachment

### ■ Description

Short tap chucks for ER collets

### ■ Application

Axial-float/tension/compression type for CNC milling machines and lathes with reversing motors and rigid tapping

DIN 69871

BT MAS-403

Straight shank

### ■ Features

- Compensates for machine feed and tap pitch variance
- Floating mechanism compensates for misalignment between tap and workpiece
- Right and left-hands tapping

### ■ Advantages

- Practical and efficient tap holding by the ER spring collet without using drive jaw
- Compact design for minimal clearance applications
- Heavy-duty design for high torque drive ensures the same accuracy as the tap itself

### ■ Operation

For through and blind hole tapping

- ①** Enter feed rate according to thread pitch (or 1-2% lower), and set spindle to starting point with 0.08mm clearance.

- ②** Start spindle forward with right hand rotation until reaching desired depth.

- ③** Stop feed and rotation and reverse to starting point.

## Modular Precision Tooling

The Taegutec logo is located in the bottom right corner. It consists of the word "TAEGUTEC" in a white, sans-serif font, arched over a stylized white graphic that resembles a large, bold letter "H" or a series of parallel lines forming a circular shape.This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Technical drawing of a shaft assembly. The drawing shows a shaft with a blue finish, a central hole, and a keyway. The dimensions are labeled as follows:

- LF(assembly)**: Total length of the assembly.
- Lmax**: Maximum length of the shaft.
- OAL**: Overall length of the shaft.
- DCONWS**: Diameter of the shaft.

**ADVANCECUTTING**  
TaeguTec

ST-MB straight carbide shank with MB connection assembly options

ST16-ST32 MB16-MB32  
Diameter range: 18-50 mm

Technical drawing of a cylindrical component. The drawing shows a side view of the cylinder with a flange on the left. Dimensions are indicated: DCONMS is the diameter of the flange, LPR is the length of the main cylinder body, and DCONWS is the diameter of the main cylinder body. The drawing includes a centerline and a dashed line indicating the internal structure of the cylinder.

- ▶ When using the MPT system, it is strongly recommended that the user utilizes the tool pre-setting equipment provided to set the radial cutting edges. The boring bars that are equipped with two inserts holders are for rough machining and heavy stock removal.
- ▶ The bars are applicable to three types of machining scenarios:
  - When two IHSR insert holders are on the same plane, the two cutting edges are placed at identical radial distances for high feed rough machining(Fig. 1).
  - When each IHCR and IHSR insert is not set on the same plane, each of the two cutting edges is placed at a different radial distance for deep rough machining(Fig. 2).
  - If boring bars are set with a single insert holder it allows rough and finish machining with normal chip removal. In this situation, it is strongly recommended that a serrated surface protection plate (PLT) is used(Fig. 3).

# Recommended Cutting Conditions

## BHR rough boring heads

## Cutting depth

It's advisable to start with  
 $B \text{ hole} \geq \text{boring bar diameter } d$

| B<br>Working range | ap (mm)<br>Steel | ap (mm)<br>Cast iron, Aluminum |
|--------------------|------------------|--------------------------------|
| 18-20              | 1.5-2            | 2-2.5                          |
| 28-50              | 2-3              | 2.5-3.5                        |
| 50-68              | 3-4              | 3.5-5                          |
| 68-200             | 4-5              | 5-7                            |
| 200-500            | 5-6              | 6-8                            |

► In case of a single or a stepped boring cutter configuration, only half the feed should be applied

► N.R. = Not recommended

► In case of a single or a stepped boring cutter configuration, only half the feed should be applied

# Technical Data

## ► Fine boring head BHF 16-50 and BHE operating instructions

### ■ Assembly

- When mounting the BHF boring head, the expanding pin should be kept tightly inside the cylindrical body
- Insert the BHF into the shank
- Tighten the pin ❷ by turning clockwise

The recommended tightening torque guidelines are as follows:

| Recommended Torque | (N·m)       |
|--------------------|-------------|
| BHF MB16 - 16 x 34 | 2.0 - 2.5   |
| BHF MB20 - 20 x 40 | 4.0 - 4.5   |
| BHF MB25 - 25 x 50 | 6.5 - 7.5   |
| BHF MB32 - 32 x 63 | 7.0 - 8.0   |
| BHF MB40 - 40 x 80 | 16.0 - 18.0 |
| BHF MB50 - 50 x 60 | 30.0 - 35.0 |

- Insert screw ❸ until it completely enters the recess in the sleeve nut or boring bar

### ■ Disassembly

- Loosen the pin ❷ by turning counter-clockwise

### ■ Positioning

- Loosen the screw ❹ before making any slide adjustment
- By turning the graduated dial ❸ counterclockwise, set the tool slide ❷ allowance for a 4mm adjustment
- Lock the tool slide by means of screw ❹, to the desired position
- Lock the screw ❹
- When making any slide adjustment, firstly loosen the screw ❹

### ■ Maintenance

Weekly:

- Lubricate through the oiling nipple ❸ with ISO UN G220 oil

Periodically:

- Clean the conical cylindrical surface and then lubricate
- Grease the expanding pin ❷ with an anti-friction lubricant
- Clean and lubricate the tool slide guideway

### ■ Important note:

- Toolholder should be firmly affixed to the slide at all times

\* Due to back-lash phenomenon, if you pass the required value, turn the dial ❸ in the reverse direction at least one rotation and then re-adjust in the original direction

# SFEED-RUSH Grades

## ► Milling SFEED-RUSH grades

SFEED-RUSH grades have upgraded toughness and chipping resistance through special post-coating treatment process of CVD grades. Through the post-coating treatment process, single color inserts have been transformed into two different colors, on the side and the top (see the illustrations below).

| ISO class | Grade  | ISO Rage | Insert color                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
